

Automated Membership

Status: Shape Go

Frame

Problem

- The company is hiring thousands of people this year, in record numbers, over-straining existing processes. Employees are burdened with work-around work.
- New Hires spend precious time learning unnecessary details about what access they need, which groups grant them access, and who can assist.
- Each week People Ops across organizations figure out who has recently joined the company, and add them to groups. Staying on-top of each new person, from disparate sources, is error-prone.

Outcome

- New Hire's have access to their necessary tools and data without doing anything.
- People Ops and other group owners no longer filter for and keep track of every new hire. Instead, group membership is automatic.
- In other years, when the headcount is maintained and attrition continues, onboarding remains streamlined.

Shape

Automation for Each Group

- Within the existing Groups Manager UI, each group will have a section for Automated Membership. It summarizes the configured Rule, including Filters and Actions.
- When Group Owners want to modify the Rule, a Configuration Page is given.
- Group Owners have the option to modify or delete the automation Rule, while all users can view the automation Summary.

Filter For Employees

- When a Rule is created or modified, a Configuration Page opens up to set the automation.
- Filtering is based upon HR's employee profile data. Three parts make a Filter: [attribute name] [operator] [attribute value]. For example: Title is Engineer.
- Filters can be chained together using all ANDs or all ORs.
- Some operators like "is one of" allow for multiple values and give a second layer to filtering.
- Auto-populating valid values is too big for 6-weeks, so we can link a Google Sheet with the valid values for user reference.

Set when Employees are Added to a Group

- By default all new hires are added to a group via the Create operation.
- In addition, when an employee moves organizations, or otherwise has a change to the profile, they can be added to a group with the Update operation.

Systems Diagram

Removing employees from groups when they leave the company, via the Suspend operation, is already taken care of by the Onboarding / Offboarding Pipeline. Automated Membership programmatically adds people to groups beyond the existing Pipeline.

Nice-to-Have's and No-Go's

- Is_Manager attribute is nice-to-have. A common use-case is membership based on whether someone is a People Manager. Currently HR does not send us this data, and the filter rules are not powerful enough to make the query. We may be able to derive it ourselves by checking if each person has direct reports and at least one of those reports is not a Consultant. Or HR sends us this attribute.
- Free-form / Deeply Nested / Complex Filtering is a no-go.
- Auto-filling Attribute Values is also out of scope for this cycle.
